

Axial piston variable pump

A11V(L)O Series 41

RE 92511

Edition: 07.2017

Replaces: 05.2017

- ▶ Sizes 110 to 280
- ▶ Nominal pressure 350 bar (5100 psi)
- ▶ Maximum pressure 420 bar (6100 psi)
- ▶ Open circuit

Features

- ▶ Variable pump with axial piston rotary group in swashplate design for hydrostatic drives in open circuit.
- ▶ For use in mobile applications
- ▶ Flow is proportional to the drive speed and displacement.
- ▶ The flow can be infinitely varied by adjusting the swashplate angle.
- ▶ The pump can work either self-priming or with a charge pump.
- ▶ Spezielles Verstellgeräteprogramm mit dynamischen Stellverhalten sowie Schwenkwinkelsensor mit Hall Effekt für eine vollelektronifizierte Pumpenregelung.
- ▶ Geräuschoptimiert über den gesamten Betriebsbereich.
- ▶ Eine robuste und verschleißarme Schwenkwinkellagerung ermöglicht eine lange Lebendauer.
- ▶ Ready for Hybrid: ±100 % Schwenkwinkel ermöglichen einen Regenerativbetrieb im Motorquadrantenbereich bis zum Nenndruck.
- ▶ Compact design
- ▶ High efficiency
- ▶ High power density
- ▶ Low noise level

Notice

- ▶ Note the project planning notes on page 71.
- ▶ In addition to the type code, please specify the relevant technical data when placing your order.
- ▶ For details of the mounting situation of combination pumps, see page 67.

¹⁾ According to ANSI B92.1a

²⁾ The through drives A3, B3, C3 are equipped with universal through drives. For painting units, observe the mounting holes pattern viewed on through drive with control at top.

³⁾ Hub N60x2x28x8H according to DIN 5480

⁴⁾ Only for painting units, see position 01

⁵⁾ See also "Mounting situation of combination pumps in relation to each other" on page 66.

Hydraulic fluids

The A11V(L)O variable pump is designed for operation with HLP mineral oil according to DIN 51524.

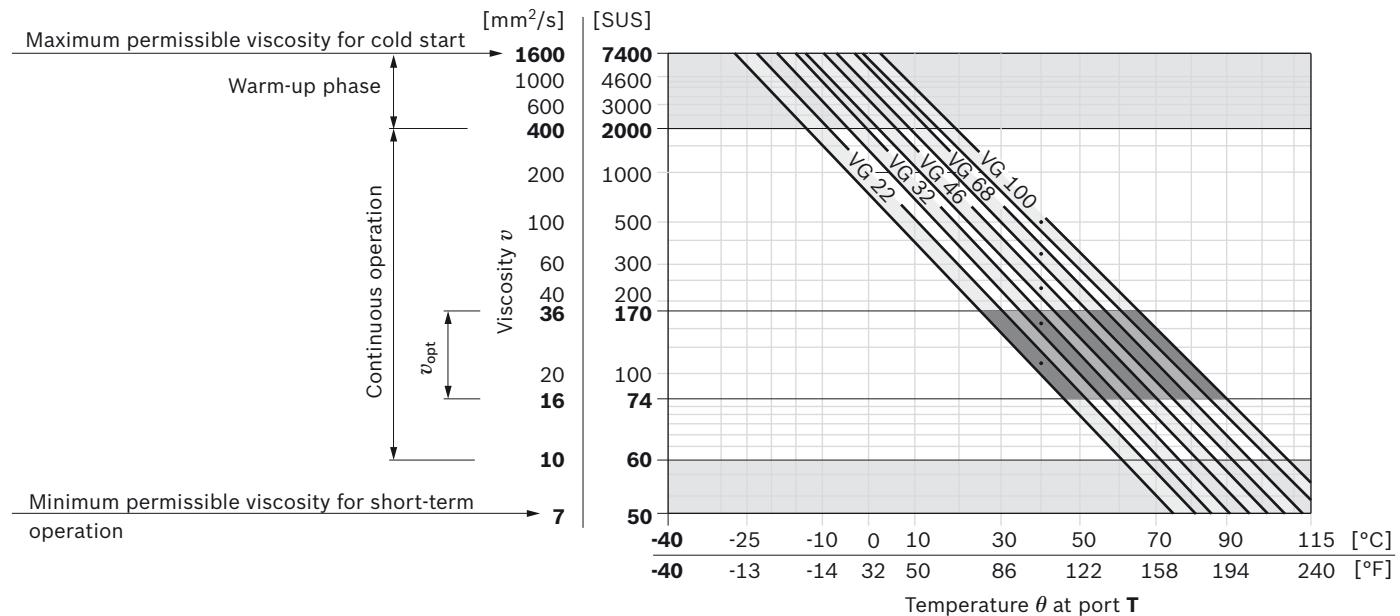

Application instructions and requirements for hydraulic fluids should be taken from the following data sheets before the start of project planning:

- ▶ 90220: Hydraulic fluids based on mineral oils and related hydrocarbons
- ▶ 90221: Environmentally acceptable hydraulic fluids
- ▶ 90222: Fire-resistant, water-free hydraulic fluids (HFDR/HFDU)

Viscosity and temperature of hydraulic fluids

	Viscosity	Shaft seal	Temperature ³⁾	Comment
Cold start	$\nu_{\max} \leq 1600 \text{ mm}^2/\text{s}$ ($\nu_{\max} \leq 7400 \text{ SUS}$)	NBR ²⁾	$\theta_{st} \geq -40^\circ\text{C} (-40^\circ\text{F})$	$t \leq 3 \text{ min}$, without load ($p \leq 50 \text{ bar (725 psi)}$), $n \leq 1000 \text{ min}^{-1}$ Permissible temperature difference between the axial piston unit and hydraulic fluid in the system max. 25 K (45 °F)
		FKM	$\theta_{st} \geq -25^\circ\text{C} (-13^\circ\text{F})$	
Warm-up phase	$\nu = 1600 \dots 400 \text{ mm}^2/\text{s}$ ($\nu = 7400 \text{ to } 1850 \text{ SUS}$)			$t \leq 15 \text{ min}$, $p \leq 0.7 \times p_{\text{nom}}$ and $n \leq 0.5 \times n_{\text{nom}}$
Continuous operation	$\nu = 400 \dots 10 \text{ mm}^2/\text{s}^1$ ($\nu = 1850 \text{ to } 60 \text{ SUS}$)	NBR ²⁾	$\theta \leq +85^\circ\text{C} (+185^\circ\text{F})$	measured at port T
		FKM	$\theta \leq +110^\circ\text{C} (+230^\circ\text{F})$	
	$\nu_{\text{opt}} = 36 \dots 16 \text{ mm}^2/\text{s}$ ($\nu_{\text{opt}} = 170 \text{ to } 74 \text{ SUS}$)			Range of optimum operating viscosity and efficiency
Short-term operation	$\nu_{\min} = 10 \dots 7 \text{ mm}^2/\text{s}$ ($\nu_{\min} = 60 \dots 50 \text{ SUS}$)	NBR ²⁾	$\theta \leq +85^\circ\text{C} (+185^\circ\text{F})$	$t \leq 3 \text{ min}$, $p \leq 0.3 \times p_{\text{nom}}$, measured at port T
		FKM	$\theta \leq +110^\circ\text{C} (+230^\circ\text{F})$	

▼ Selection diagram

¹⁾ Corresponds e.g. for VG 46 to a temperature range of 39 °F to +185 °F (+4 °C to +85 °C) (see selection diagram)

²⁾ Special version, please contact us

³⁾ If the temperature at extreme operating parameters cannot be adhered to, please contact us.

Filtration of the hydraulic fluid

Finer filtration improves the cleanliness level of the hydraulic fluid, which increases the service life of the axial piston unit.

A cleanliness level of at least 20/18/15 is to be maintained according to ISO 4406.

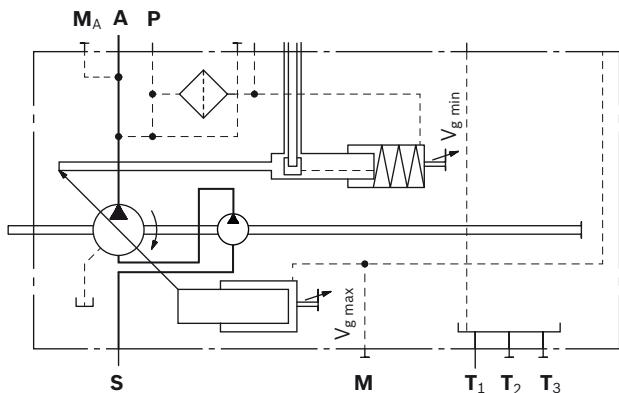

At a hydraulic fluid viscosity of less than 10 mm²/s (60 SUS) (e.g. due to high temperatures in short-term operation) at the drain port, a cleanliness level of at least 19/17/14 according to ISO 4406 is required.

For example, the viscosity is 10 mm²/s (60 SUS) at:

- HLP 32 a temperature of 73 °C (163.4 °F)
- HLP 46 a temperature of 85 °C (185 °F)

Charge pump (impeller)

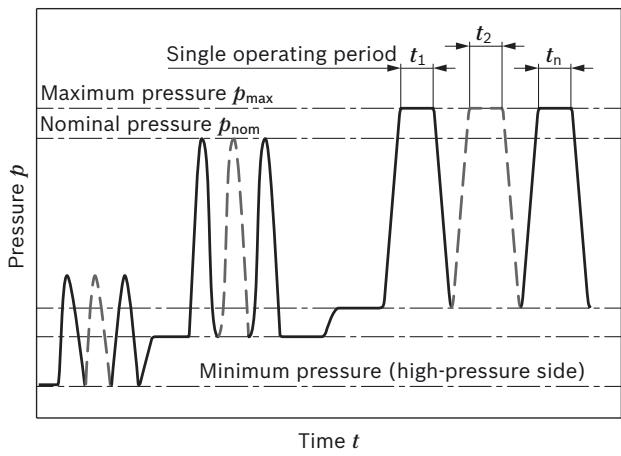

The charge pump is a centrifugal pump with which the A11VLO is filled and therefore can be operated at higher speeds. This also simplifies cold starting at low temperatures and high viscosity of the hydraulic fluid. Externally increasing the inlet pressure is therefore unnecessary in most cases. Charging the reservoir with compressed air is not permissible.

Working pressure range

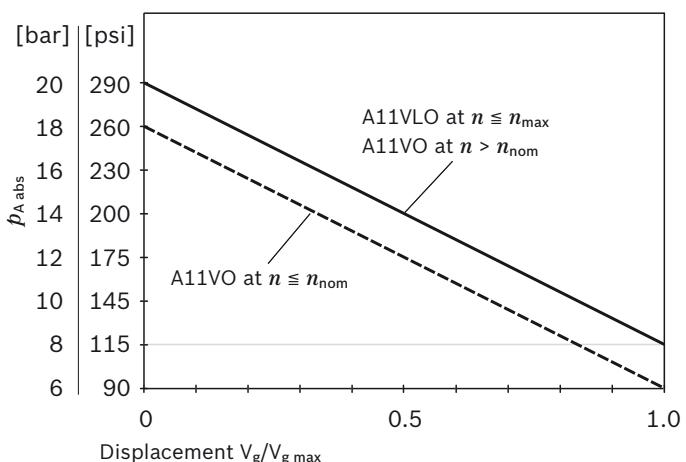

Pressure at working port A	Definition
Nominal pressure p_{nom}	350 bar (5100 psi)
Maximum pressure p_{max}	420 bar (6100 psi)
Single operating period	1 s
Total operating period	300 h
Minimum pressure $p_{\text{A abs}}$ (High-pressure side)	Minimum pressure at the high-pressure side (A) which is required in order to prevent damage to the axial piston unit. The minimum pressure depends on the rotational speed and the swivel angle (see diagram).
Rate of pressure change $R_{\text{A max}}$	16000 bar/s (232000 psi/s)
	Maximum permissible speed of pressure build-up and reduction during a pressure change across the entire pressure range.
Pressure at suction port S (inlet)	
Version without charge pump	Minimum pressure at suction port S (inlet) which is required to prevent damage to the axial piston unit. The minimum pressure depends on the rotational speed and displacement of the axial piston unit.
Minimum pressure $p_{\text{S min}}$	≥ 0.8 bar (12 psi) absolute
Maximum pressure $p_{\text{S max}}$	≤ 30 bar (435 psi)
Version with charge pump	
Minimum pressure $p_{\text{S min}}$	≥ 0.7 bar (10.5 psi) absolute
Maximum pressure $p_{\text{S max}}$	≤ 2 bar (30 psi) absolute
Case pressure at port T ₁ , T ₂ , T ₃	
Maximum static pressure $p_{\text{L max}}$	3 bar (45 psi)
	Maximum 1.2 bar (18 psi) higher than inlet pressure at port S, but not higher than $p_{\text{L max}}$. A drain line to the reservoir is required.
Pressure peaks $p_{\text{L peak}}$	6 bar (90 psi)
	$t < 0.1$ s

▼ Pressure definition

Total operating period = $t_1 + t_2 + \dots + t_n$

▼ Minimum pressure (high-pressure side)

Notice

Working pressure range valid when using hydraulic fluids based on mineral oils. Please contact us for values for other hydraulic fluids.

1) The values are applicable:

- for the optimum viscosity range from $\nu_{\text{opt}} = 36$ to 16 mm²/s (170 to 74 SUS)
- with hydraulic fluid based on mineral oils
- 2) The values apply at absolute pressure $p_{\text{abs}} = 1$ bar (15 psi) at suction port **S**.
- 3) Maximum rotational speed (rotational speed limit) in the case of increasing the inlet pressure p_{abs} at suction port **S** and $V_g < V_{g \text{ max}}$, see diagram on page 11.

4) The data are valid for values between the minimum required and maximum permissible rotational speed. Valid for external excitation (e.g. diesel engine 2 to 8 times rotary frequency; cardan shaft twice the rotary frequency). The limit value is only valid for a single pump. The load capacity of the connecting parts must be considered.

▼ Maximum permissible rotational speed (rotational speed limit)
 $p_{s\ abs}$ = inlet pressure [bar (psi)]

Notice

- The maximum permissible rotational speed n_{max} must not be exceeded (see table of values on page 9 and 10).

Determining the characteristics

Flow	$q_v = \frac{V_g \times n \times \eta_v}{1000}$	[l/min]
	$q_v = \frac{V_g \times n \times \eta_v}{231}$	[gpm]
Torque	$T = \frac{V_g \times \Delta p}{20 \times \pi \times \eta_{hm}}$	[Nm]
	$T = \frac{V_g \times \Delta p}{24 \times \pi \times \eta_{hm}}$	[lb-ft]
Power	$P = \frac{2 \pi \times T \times n}{60000} = \frac{q_v \times \Delta p}{600 \times \eta_t}$	[kW]
	$P = \frac{2 \pi \times T \times n}{33000} = \frac{q_v \times \Delta p}{1714 \times \eta_t}$	[hp]
Key		
V_g	=	Displacement per revolution [cm ³ (in ³)]
Δp	=	Differential pressure [bar (psi)]
n	=	Rotational speed [rpm]
η_v	=	Volumetric efficiency
η_{hm}	=	Hydraulic-mechanical efficiency
η_t	=	Total efficiency ($\eta_t = \eta_v \times \eta_{hm}$)

Power controller

LR – Power controller, fixed setting

The power controller regulates the displacement of the pump depending on the working pressure so that a given drive power is not exceeded at constant drive speed.

The precise control with a hyperbolic characteristic curve, provides an optimum utilization of available power.

The working pressure acts on a rocker via a measuring spool moved together with the control. An externally adjustable spring force counteracts this, it determines the power setting. The depressurized basic position is $V_g \text{ max}$.

If the working pressure exceeds the set spring force, the control valve will be actuated by the rocker and the pump will swivel back from the basic setting $V_g \text{ max}$ toward $V_g \text{ min}$. Here, the leverage at the rocker may be shortened and the working pressure may rise in the same relation as the displacement is reduced ($p_B \times V_g = \text{constant}$; p_B = working pressure; V_g = displacement).

The hydraulic output power (characteristic curve LR) is influenced by the efficiency of the pump.

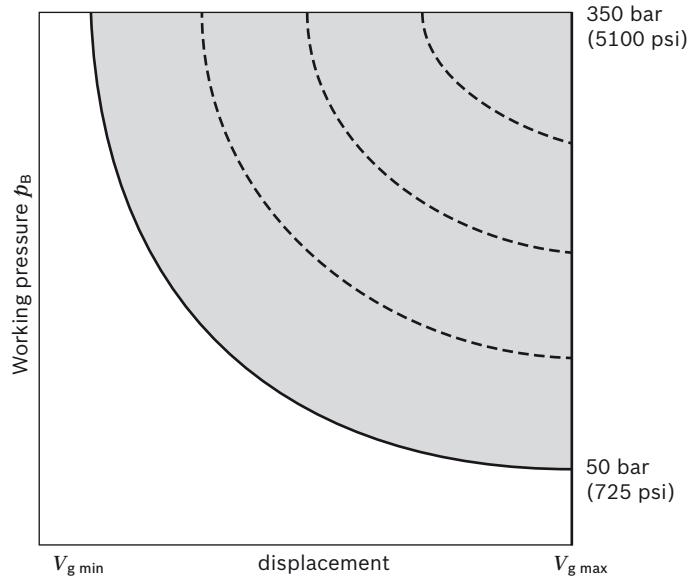

Setting range for beginning of control 50 bar (725 psi) to 350 bar (5100 psi), see table on the right.

When ordering, state in plain text:

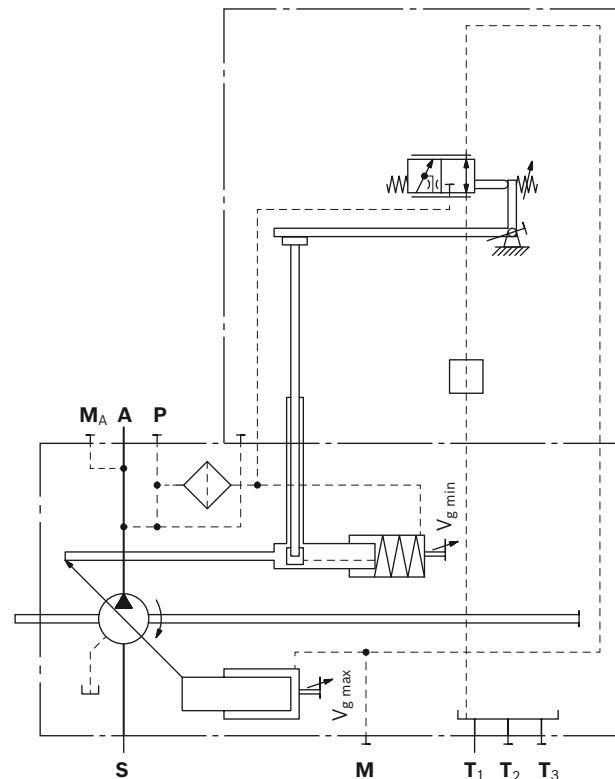

- Drive power P [kW (HP)]
- Drive speed n [rpm]
- Maximum flow $q_V \text{ max}$ [l/min (gpm)]

Please contact us if you need a power diagram.

Characteristic curve LR

L3/L4 – Power controller, electric-proportional override (negative control)

A control current acts against the adjustment spring of the power controller via a proportional solenoid.

The mechanically adjusted basic power setting can be reduced by means of different control current settings.

Increasing control current = reduced power.

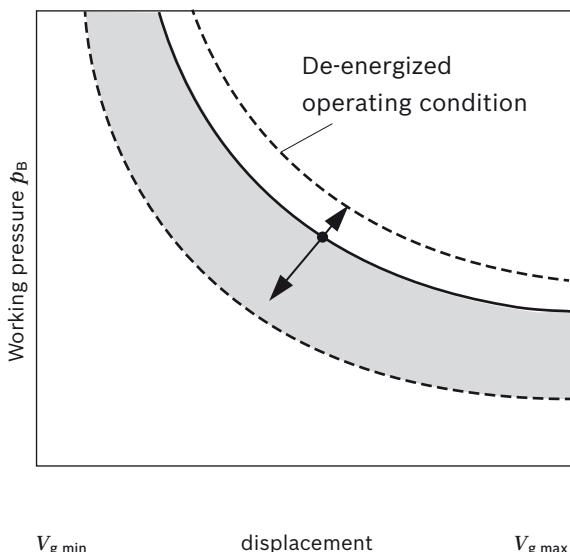

If the control current signal is variably controlled via a load limiting control, the power draw of all consumers is adjusted to the power draw possible for the diesel engine (e.g. electronic load limiting control LLC (data sheet 95310) in BODAS controller RC2-2).

Technical data, solenoid	L3	L4
Voltage	12 V ($\pm 20\%$)	24 V ($\pm 20\%$)

¹⁾ Values in the tables are reference points. Determination of the exact power override on request.

L5 – Power controller, hydraulic-proportional override (negative control)

A pilot pressure acts against the adjustment spring of the power controller via a valve.

The mechanically adjusted basic power setting can be reduced by means of different pilot pressure settings.

Increasing pilot pressure = reduced power.

► Maximum permissible pilot pressure

$$p_{st\ max} = 100 \text{ bar (1450 psi)}$$

If the pilot pressure signal is adjusted by a load limiting control, the power reduction of all consumers is reduced to match the available power from the diesel engine.

Reduction of power by pilot pressure at port **L5**

Power reduction/pilot pressure [kW (hp)/bar (psi)]

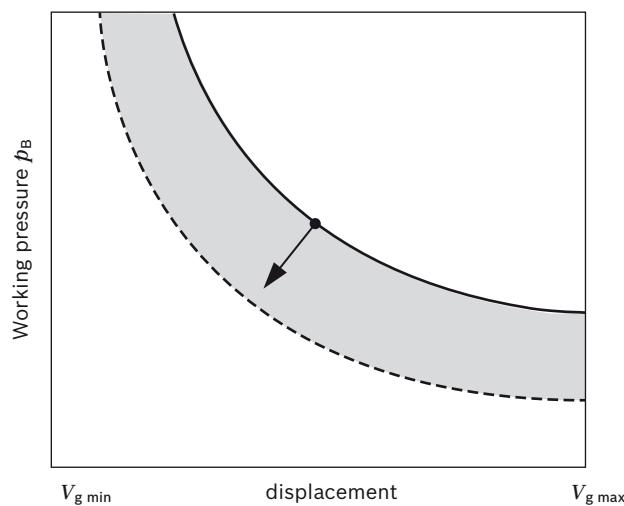

Size	Rotational speed [rpm]		
	1000	1500	1800
110	2.3 (3.1)	3.5 (4.7)	4.1 (5.5)

280	4.4 (5.9)	6.6 (8.9)	7.9 (10.6)

Values in the tables are reference points. Determination of the exact power override on request.

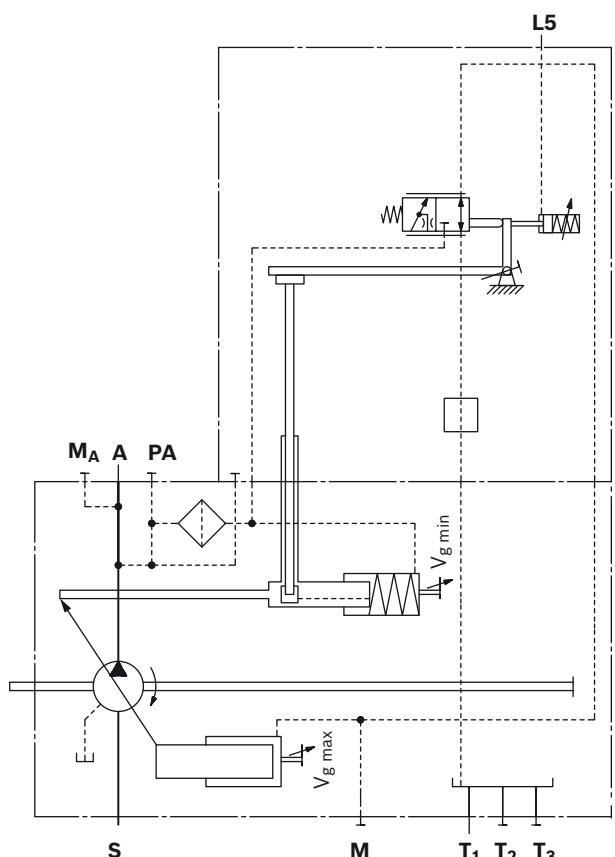

When ordering, state in plain text:

- Drive power P [kW (hp)] at a pilot pressure of p_{st} in **L5** of 5 bar (75 psi)
- Drive speed n [rpm]
- Maximum flow $q_{v\ max}$ [l/min (gpm)]

▼ Effect of power override through pilot pressure increase

▼ Circuit diagram L5

L6 – Power controller, hydraulic-proportional override (positive control)

A pilot pressure acts together with the adjustment spring of the power controller via a valve.

The mechanically adjusted basic power setting can be increased by means of different pilot pressure settings.

Increasing pilot pressure = increased power.

- Maximum permissible pilot pressure

$$p_{st\ max} = 100 \text{ bar (1450 psi)}$$

If the pilot pressure signal is adjusted by a load limiting control, the power increase of all consumers is increased to match the available power from the diesel engine.

Power increase by pilot pressure at port **L6**

Power increase/pilot pressure [kW (hp)/bar (psi)]

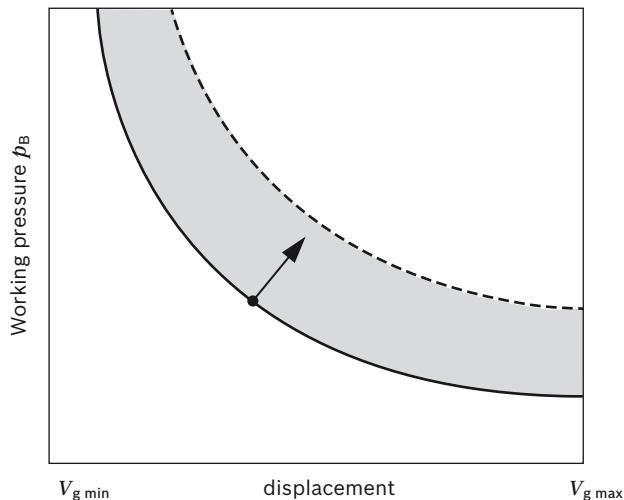

Size	Rotational speed [rpm]		
	1000	1500	1800
110	2.4 (3.2)	3.6 (4.8)	4.3 (5.8)
145	2.9 (3.9)	4.3 (5.8)	5.2 (7.0)

280	4.5 (6.0)	6.8 (9.1)	8.1 (10.9)

Values in the tables are reference points. Determination of the exact power override on request.

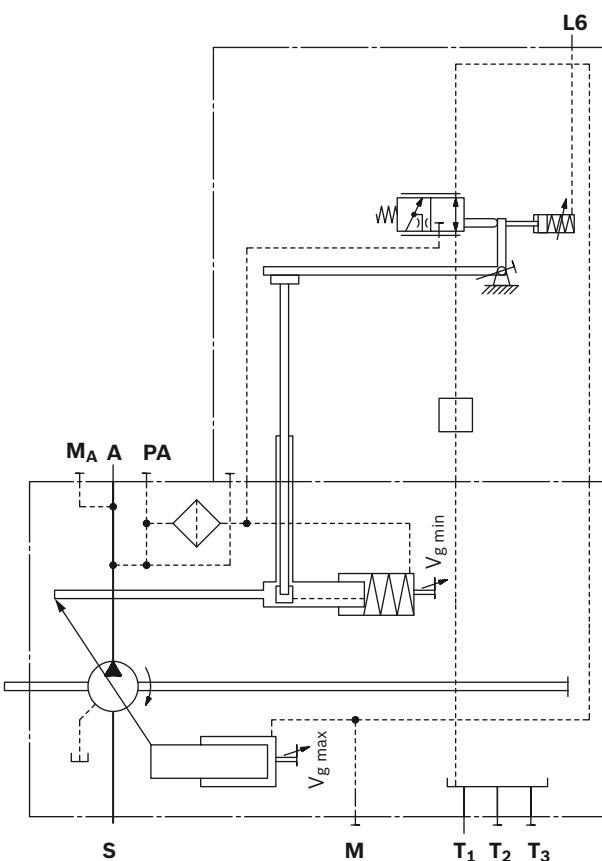

When ordering, state in plain text:

- Drive power P [kW (hp)] at a pilot pressure of p_{st} in **L6** of 5 bar (75 psi)
- Drive speed n [rpm]
- Maximum flow $q_V\ max$ [l/min (gpm)]

▼ Effect of power override through pilot pressure increase

▼ Circuit diagram L6

CR – Summation hp-control of two power-controlled pumps, high-pressure-related override (with stop)

With two pumps of the same size working in different operating circuits, the CR controller limits the overall power.

The CR works like the normal LR with a fixed maximum power setting along the power hyperbola. The high-pressure-related override reduces the power setpoint in dependence on the working pressure of the other pump. That happens proportionally below the beginning of control and is blocked by a stop when the minimum power is reached. Here, the **CR** port of the one pump has to be connected to the **M_A** port of the other pump.

The maximum power of the first pump is reached when the second pump is working at idle when depressurized. When defining the maximum power, the idle power of the second pump has to be taken into account.

The minimum power of each pump is reached when both pumps are working at high pressure. The minimum power usually equates to 50% of the total power.

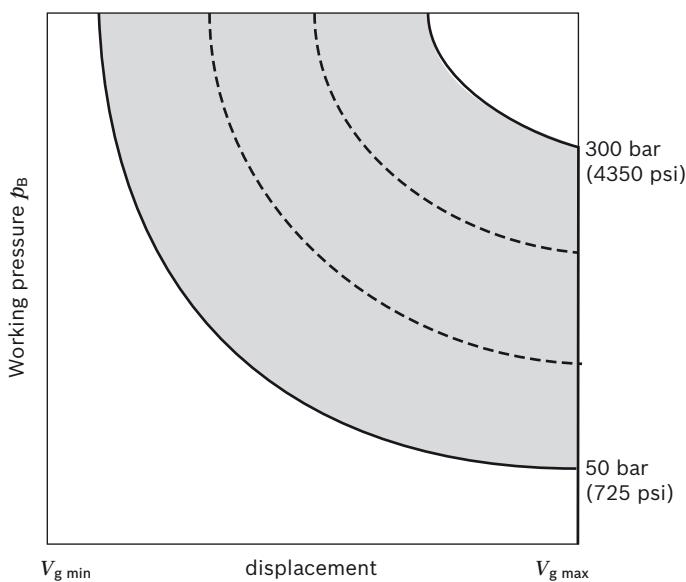

Power that is released by the pressure controller or other overrides remains unconsidered.

Setting range for beginning of control 50 bar (725 psi) to 300 bar (4350 psi).

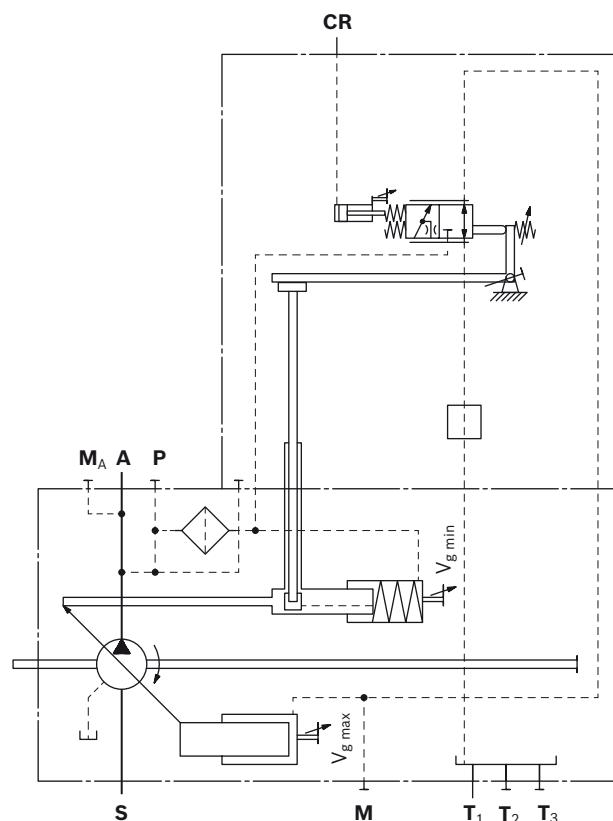

When ordering, please specify separately for each pump:

- ▶ Maximum drive power P_{\max} [kW (hp)]
- ▶ Minimum drive power P_{\min} [kW (hp)]
- ▶ Drive speed n [rpm]
- ▶ Maximum flow $q_V \max$ [l/min (gpm)]

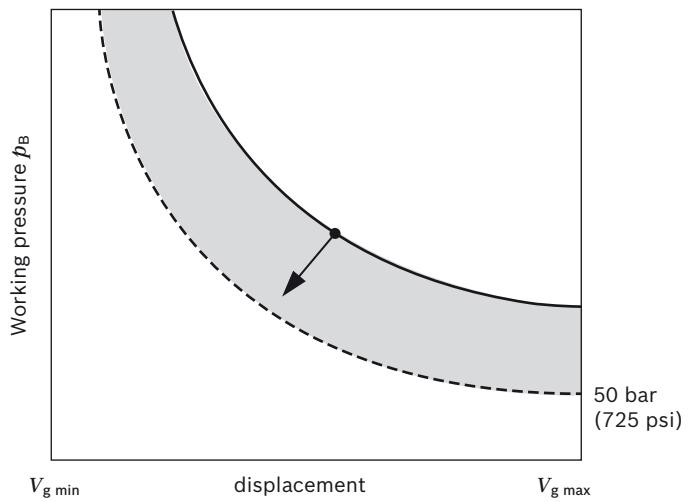

▼ Characteristic curve CR

▼ Circuit diagram CR

▼ Effect of power override of a pump with increasing pressure in the 2nd Pump

PR – Summation hp-control of two power-controlled pump and a constant pump

Together with the mounted fixed pump, the PR controller on an A11V(L)O effects a limitation of the overall power. The PR works like the normal LR with a fixed maximum power setting along the power hyperbola. The high-pressure-dependent override reduces the power specification in proportion to the working pressure of the fixed pump. Here, port **PR** of the A11V(L)O must be connected to the working pressure of the fixed pump. The power of the controlled pump can then be reduced to zero in a borderline case.

The maximum power of the controlled pump is reached when the fixed pump works at idle when depressurized. When defining the maximum power, the idle power of the fixed pump has to be taken into account.

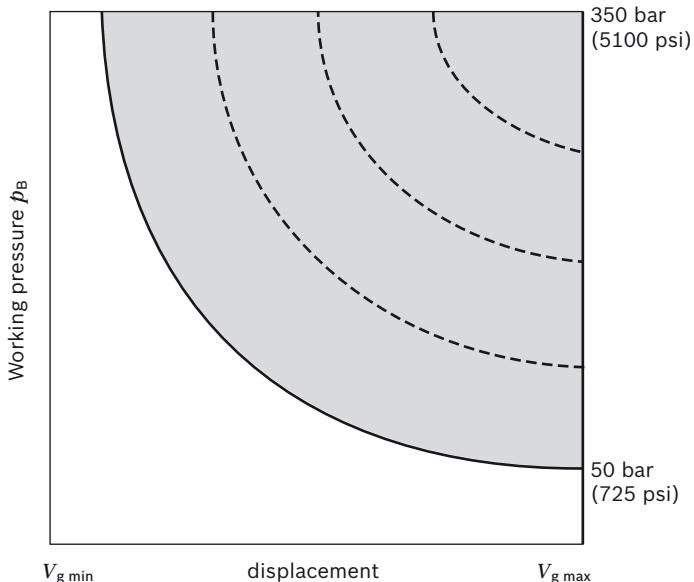

Power that is released by the pressure controller or other overrides remains unconsidered.

Setting range for beginning of control 50 bar (725 psi) to 350 bar (5100 psi).

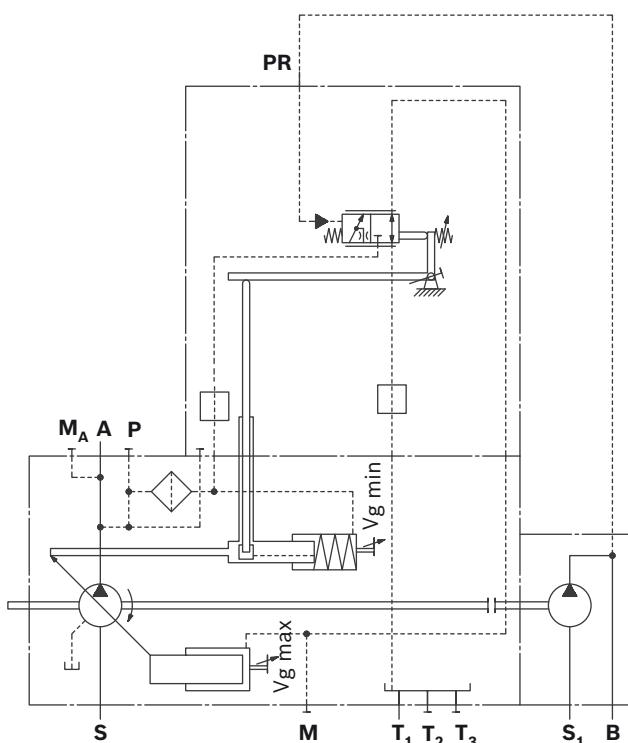

When ordering, state in plain text:

- ▶ Maximum drive power P_{\max} [kW (hp)]
- ▶ Drive speed n [rpm]
- ▶ Maximum flow $q_V \max$ [l/min (gpm)]
- ▶ Size of the fixed pump

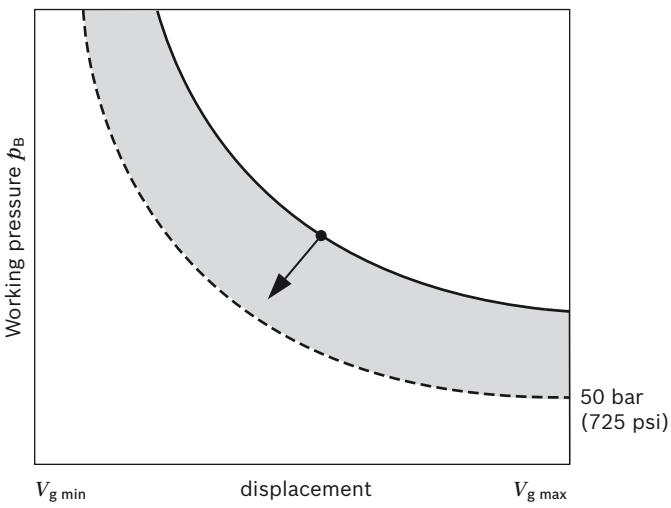

▼ Characteristic curve PR

▼ Circuit diagram PR

▼ Effect of power override of a pump with increasing pressure in the 2nd Pump

Stroke control

E1/E2 – Stroke control, electric, proportional (positive control)

With the electrical stroke control with proportional solenoid, the pump displacement is steplessly adjusted in proportion to the current via the magnetic force.

Basic position without pilot signal is $V_g \text{ min}$. Mechanically depressurized basic position is $V_g \text{ min}$ (see type code position 08, letter C).

With increasing control current the pump swivels to a higher displacement (from $V_g \text{ min}$ to $V_g \text{ max}$).

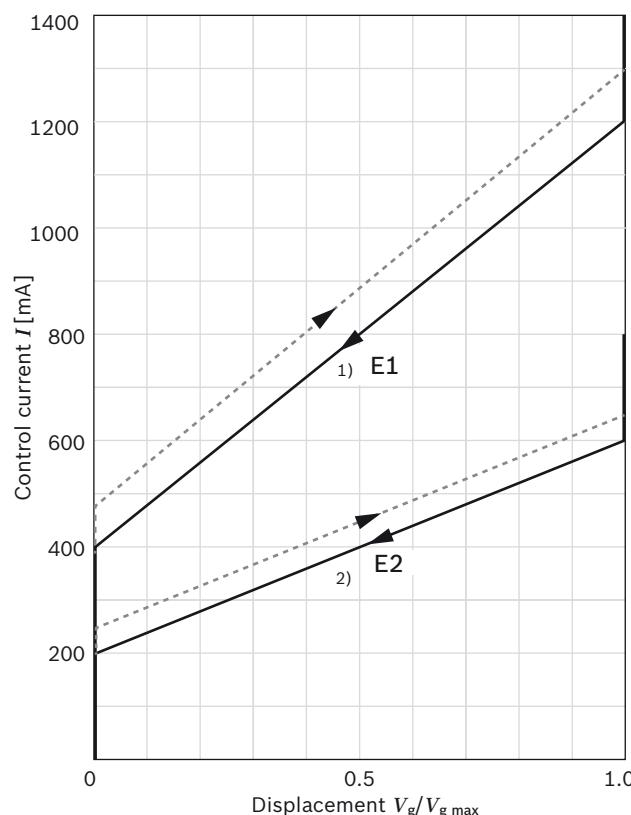

The necessary control fluid is taken from the working pressure or the external control pressure applied to port **P**.

If the pump is to be adjusted from the basic position $V_g \text{ min}$ or from a low working pressure, port **P** must be supplied with an external control pressure of at least 30 bar (435 psi), maximum 50 bar (725 psi).

Notice

If there is no external control pressure applied to **P**, the version "Maximum swivel angle ($V_g \text{ max}$), without external control pressure supply" must be ordered (see type code position 08, A).

▼ Characteristic curve E1/E2

Various BODAS controllers with application software and amplifiers are available for controlling the proportional solenoids.

- ▶ RC series 30, data sheet 95204
- ▶ RC series 30, data sheet 95205
- ▶ RC series 31, data sheet 95206

Further information can also be found on the Internet at www.boschrexroth.com/mobile-electronics.

End of control at $V_g \text{ max}$	1200 mA ¹⁾	600 mA ²⁾
Current limit	1.54 A	0.77 A
Nominal resistance (at 20 °C (68 °F))	5.5 Ω	22.7 Ω
Dither frequency	100 Hz	100 Hz
Duty cycle	100%	100%
Type of protection: see connector version page 68		

When ordering, state in plain text:

- ▶ Drive speed n [rpm]
- ▶ Maximum flow $q_V \text{ max}$ [l/min (gpm)]
- ▶ Minimum flow $q_V \text{ min}$ [l/min (gpm)]

See circuit diagram on page 20

Notice!

The spring feedback in the controller is not a safety device.

The controller can stick in an undefined position due to internal contamination (contaminated hydraulic fluid, abrasion or residual contamination from system components). As a result, the flow of the axial piston unit will no longer respond correctly to the operator's commands.

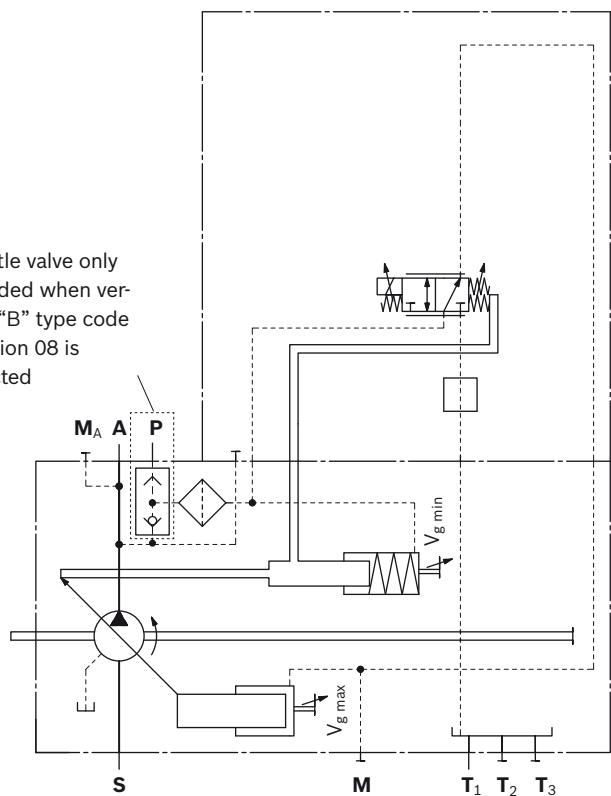

Check whether the application on your machine requires additional safety measures, in order to bring the driven consumer into a safe position (immediate stop). If necessary, make sure that these are properly implemented.

¹⁾ Because of the control hysteresis, a control current of up to 1300 mA may be required for the $V_g \text{ max}$ position.

²⁾ Because of the control hysteresis, a control current of up to 650 mA may be required for the $V_g \text{ max}$ position.

H4 – Stroke control, hydraulic-proportional, pilot pressure (positive control)

With pilot-pressure-related control, the pump displacement is adjusted in proportion to the pilot pressure applied at port **H4**.

Basic position without pilot signal is $V_g \text{ min}$. Mechanically depressurized basic position is $V_g \text{ min}$ (see type code position 08, letter C).

- ▶ Adjustment from $V_g \text{ min}$ to $V_g \text{ max}$; with increasing pilot pressure the pump swivels to a larger displacement.
- ▶ Setting range for beginning of control (at $V_g \text{ min}$) 5 bar (75 psi) to 10 bar (145 psi), standard is 10 bar (145 psi). State beginning of control in plain text in the order.
- ▶ Maximum permissible pilot pressure $p_{st \text{ max}} = 100$ bar (1450 psi)

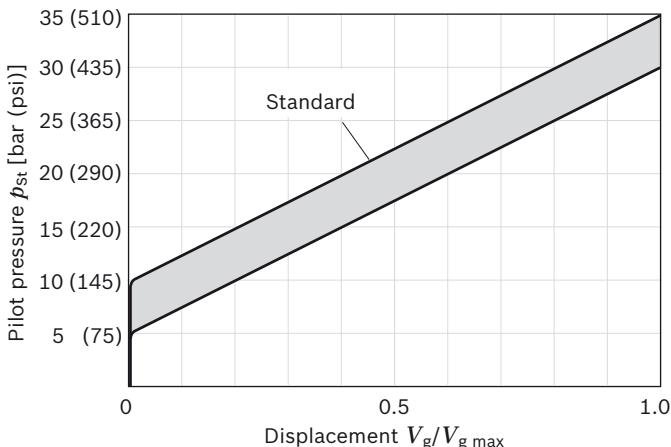

The necessary control fluid is taken from the working pressure or the external control pressure applied to port **P**.

If the pump is to be adjusted from the basic position $V_g \text{ min}$ or from a low working pressure, port **P** must be supplied with an external control pressure of at least 30 bar (435 psi), maximum 50 bar (725 psi).

Notice

If there is no external control pressure applied to **P**, the version "Maximum swivel angle ($V_g \text{ max}$), without external control pressure supply" must be ordered (see type code position 08, letter A).

▼ Characteristic curve H4 (positive)

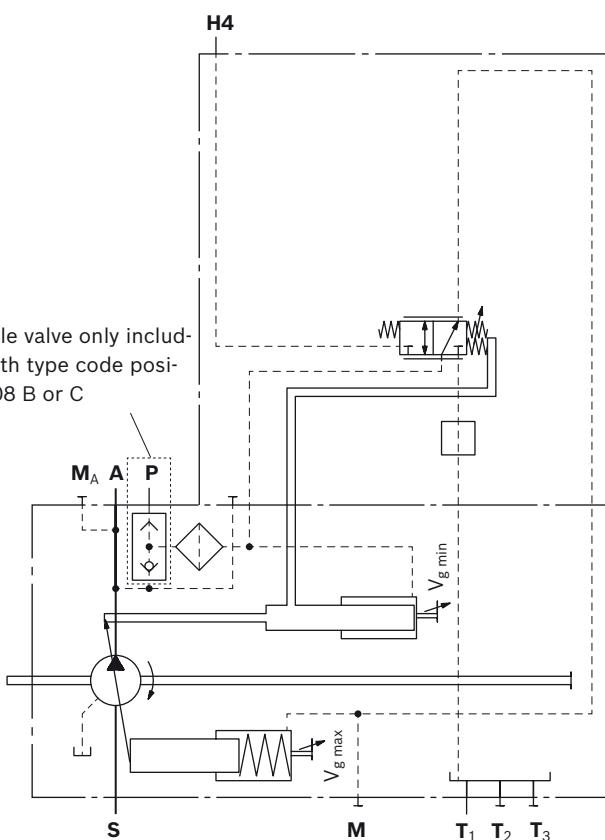

Increase in pilot pressure $V_g \text{ min}$ to $V_g \text{ max}$: $\Delta p = 25$ bar (365 psi)

When ordering, state in plain text:

- ▶ Beginning of control [bar (psi)] at $V_g \text{ min}$

▼ Circuit diagram H4

Notice!

The spring feedback in the controller is not a safety device.

The controller can stick in an undefined position due to internal contamination (contaminated hydraulic fluid, abrasion or residual contamination from system components). As a result, the flow of the axial piston unit will no longer respond correctly to the operator's commands. Check whether the application on your machine requires additional safety measures, in order to bring the driven consumer into a safe position (immediate stop). If necessary, make sure that these are properly implemented.

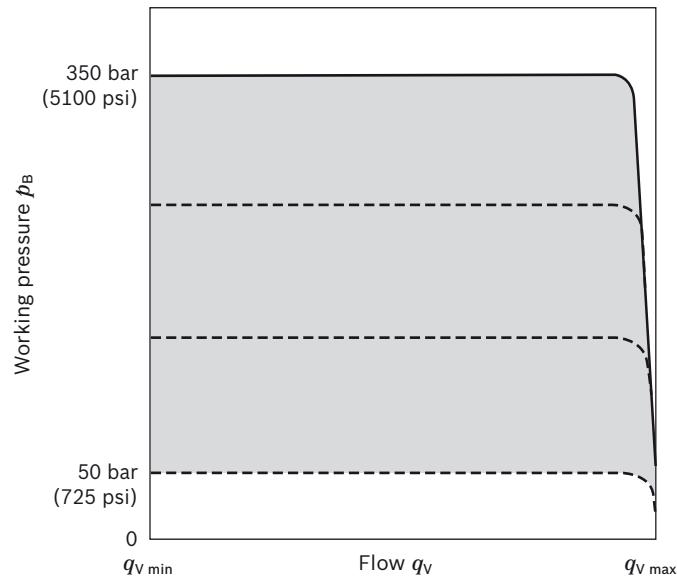

Pressure controller

DR – Pressure controller with one-sided swiveling, fixed setting

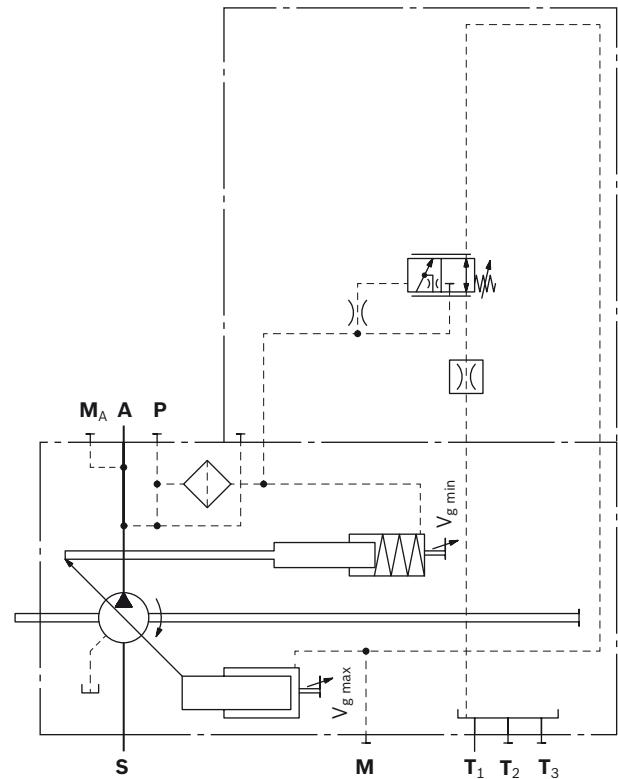

The pressure controller limits the maximum pressure at the pump outlet within the control range of the variable pump. The variable pump only supplies as much hydraulic fluid as is required by the consumers. If the working pressure exceeds the pressure command value at the pressure valve, the pump will regulate to a smaller displacement to reduce the control differential.

- ▶ Initial position in depressurized state: $V_g \text{ max}$
- ▶ Setting range for beginning of pressure control 50 bar (725 psi) to 350 bar (5100 psi), 350 bar (5100 psi) is standard.

Characteristic curve DR

▼ Circuit diagram DR

DRS0 – Pressure controller with load sensing

The load sensing controller works as a load-pressure controlled flow controller and adjusts the displacement of the pump to the volume required by the consumer.

The flow of the pump is then dependent on the cross section of the external metering orifice (1), which is located between the pump and the consumer. Below the setting of the pressure controller and within the control range of the pump, the flow is not dependent on the load pressure.

The metering orifice is usually a separately located load-sensing directional valve (control block). The position of the directional valve spool determines the opening cross-section of the metering orifice and thus the flow of the pump.

The load sensing controller compares pressure before and after the metering orifice and keeps the pressure drop (differential pressure Δp) across the orifice – and therefore the flow – constant.

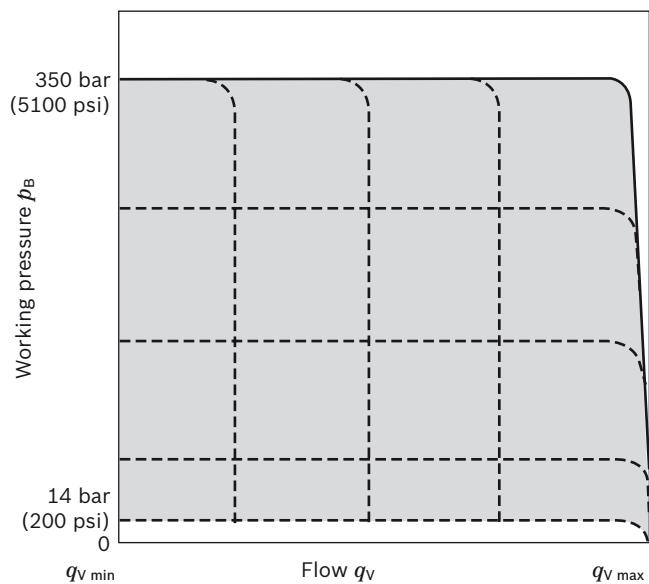

If the differential pressure Δp at the metering orifice rises, the pump is swiveled back (toward $V_{g \text{ min}}$). If the differential pressure Δp drops, the pump is swiveled out (toward $V_{g \text{ max}}$) until equilibrium at the metering orifice is restored.

$$\Delta p_{\text{metering orifice}} = p_{\text{pump}} - p_{\text{consumer}}$$

- ▶ Setting range for Δp 14 bar (200 psi) to 30 bar (435 psi)
(please state in plain text)
- ▶ Standard adjustment 14 bar (200 psi)

The stand-by pressure in zero-stroke operation (metering orifice closed) is slightly higher than the Δp setting.

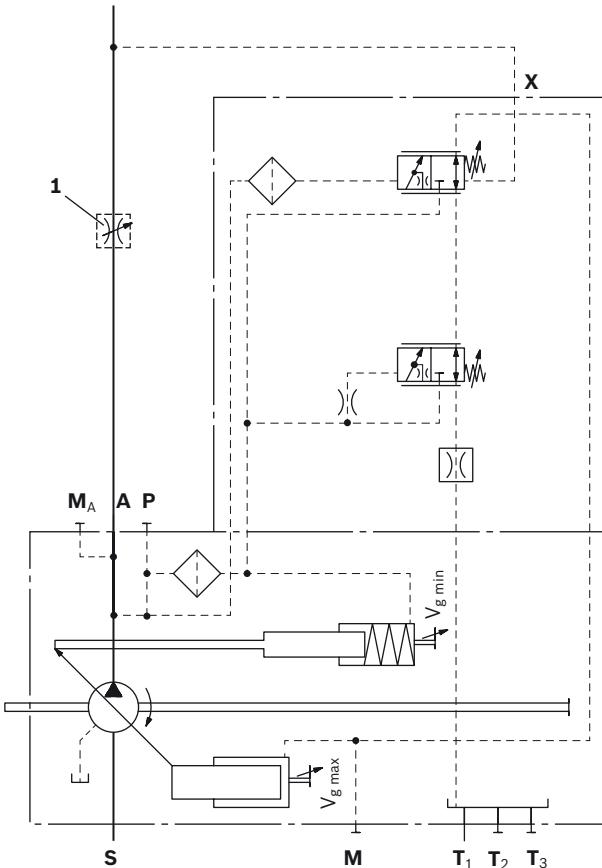

▼ Characteristic curve DRS0

When ordering, state in plain text:

- ▶ Pressure setting p [bar (psi)] at pressure controller DR
- ▶ Differential pressure Δp [bar (psi)] at load sensing controller S0

▼ Circuit diagram DRS0

- 1 The metering orifice (control block) is not included in the scope of delivery.

DG – Pressure controller with one-sided deflection, hydraulically remote controlled (positive control)

The remote controlled pressure controller has a fixed-setting Δp value. A separately connected pressure relief valve at port X (1) enables the pressure controller to be remotely controlled.

- ▶ Setting range Δp 14 bar (200 psi) to 25 bar (365 psi)
- ▶ Recommended value 20 bar (290 psi) (standard)
- ▶ Control volume at X: about 1.6 l/min (0.42 gpm) (static) at Δp 20 bar (290 psi)

In addition a separately configured 2/2 directional valve (2) can be operated to start the pump with low working pressure (standby pressure).

Both functions can be used individually or in combination (see circuit diagram).

The external valves are not included in the scope of delivery.

As a separate pressure relief valve (1) we recommend:

- ▶ For DBD.6, see data sheet 25402
- ▶ Working pressure p in bar (psi) (test pressure for DG)
- ▶ Differential pressure Δp in bar (psi)
- ▶ Drive speed n in rpm
- ▶ Maximum flow $q_{V_{\max}}$ in l/min (gpm)

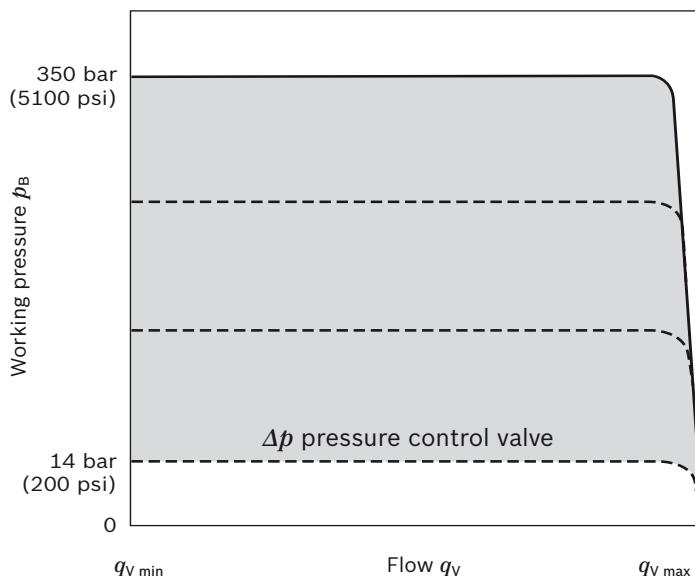

Note for setting remote-controlled pressure control

The setting value for the external pressure relief valve plus the differential pressure value at the pressure control valve determines the level of pressure control.

Example:

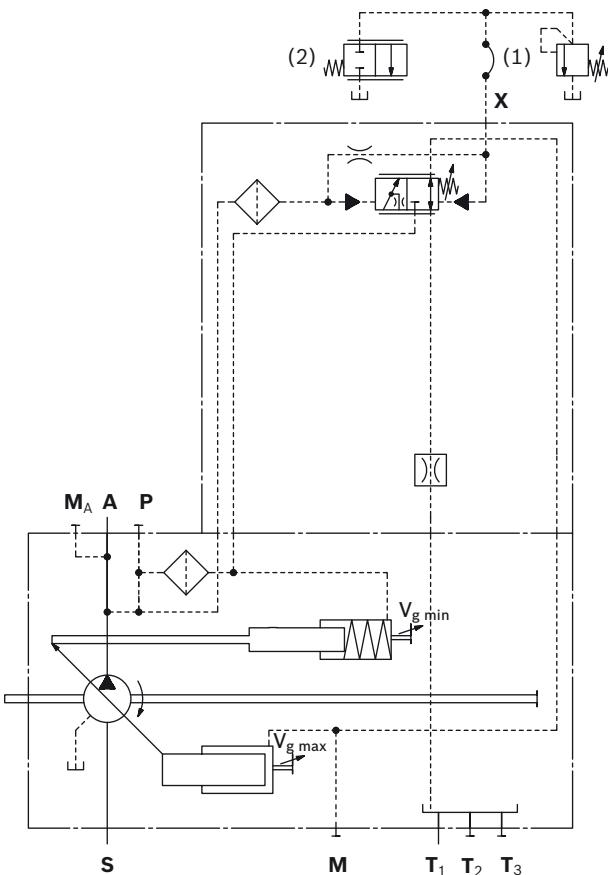

- ▶ external pressure relief valve 330 bar (4800 psi)
- ▶ Differential pressure at pressure control valve 20 bar (290 psi)
- ▶ resulting pressure control with $330 + 20 = 350$ bar ($4810 + 290 = 5100$ psi)

▼ Characteristic curve DG

For function and description of pressure controller DR, see page 23

▼ Circuit diagram DG

1 Pressure-relief valve (not included in the scope of delivery)

2 2/2 directional valve (not included in the scope of delivery)

D2 – Proportional pressure controller with one-side swiveling, electric override (positive control)

The pressure controller keeps the pressure in a hydraulic system constant within its control range even under varying flow conditions. The variable pump only supplies as much hydraulic fluid as is required by the consumers.

If the working pressure exceeds the setting at the integrated pressure control valve, the pump is automatically swiveled back to reduce the control differential.

- ▶ Initial position in depressurized state: $V_{g \text{ max}}$
- ▶ Pressure controller basic setting: 32 bar (470 psi)/300 mA

The basic setting of the pressure controller can be overridden. The pressure controller value is proportional to the electrical current acting on the solenoids of the pressure reducing valve.

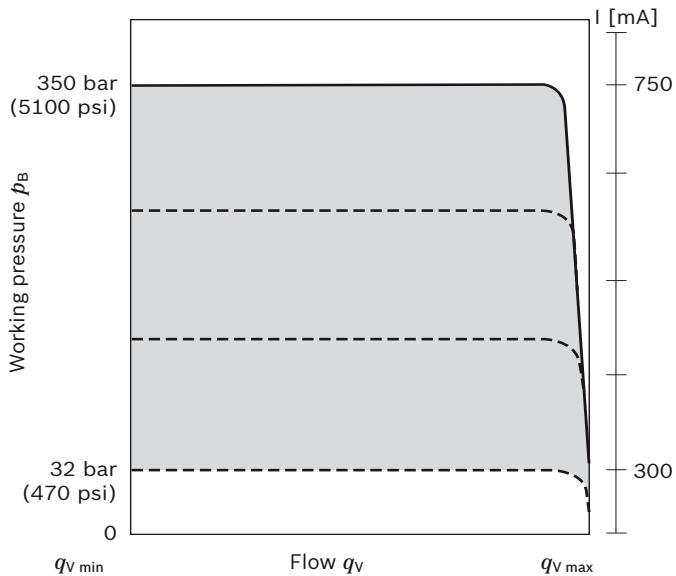

- ▶ Pressure setting overridden:
32 bar (470 psi)/300 mA to 350 bar (5100 psi)/750 mA
- ▶ Auxiliary pressure for controlling D2 at port Y:
 $p_{\text{min}} = 40 \text{ bar (580 psi)}$; $p_{\text{max}} = 50 \text{ bar (725 psi)}$.
Port X acts solely as a measuring port ($p_{\text{max}} 50 \text{ bar (725 psi)}$). Pressurization leads to an impermissible increase in pressure.

Notice

Applying current above the limit of 750 mA to the proportional solenoid results in an impermissible increase in pressure.

Make sure that currents above the permissible limit are not applied to the proportional solenoid.

▼ Characteristic curve D2

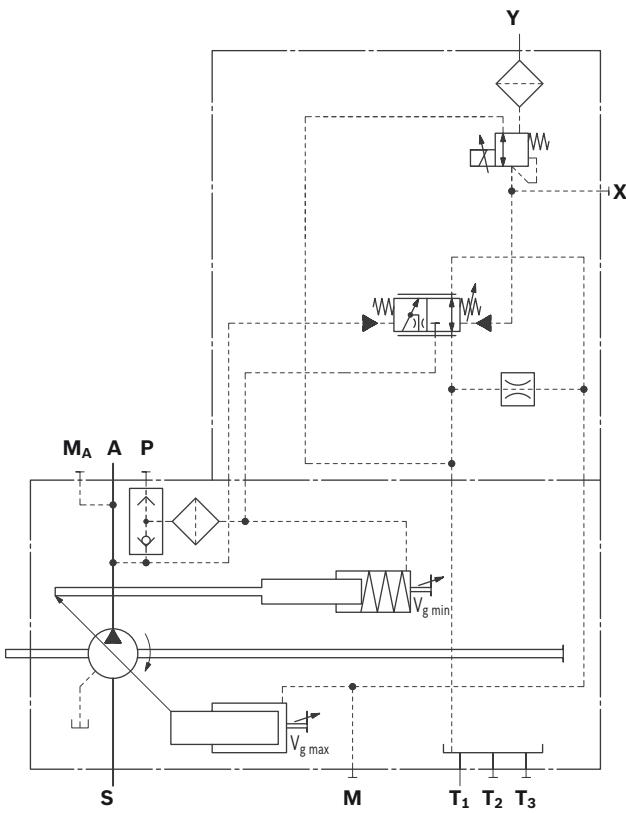

Technical data, solenoid	D2
Voltage	24 V
Control current	
Start of control at $V_{g \text{ min}}$	300 mA
End of control at $V_{g \text{ max}}$	750 mA
Current limit	750 mA
Nominal resistance (at 20 °C (68 °F))	12 Ω
Dither frequency	200 Hz
Duty cycle	100%
Type of protection: see connector version page 68

DGT6 – With integrated pilot control valve, electric-proportional override (positive control)

The remote controlled pressure controller has a fixed-setting Δp value. An electric pressure relief valve (pilot valve) integrated in the control valve enables remote pressure control.

- Fixed value at Δp 14 bar (200 psi).

When ordering, state in plain text:

- Maximum pressure p_{\max} [bar (psi)] (pressure on port **A**) with 1200 mA current.

Pilot valve T6

The electric-proportional pressure relief valve is directly controlled with a positive control as cartridge version (see data sheet 18139-08).

The following pressure settings are available:

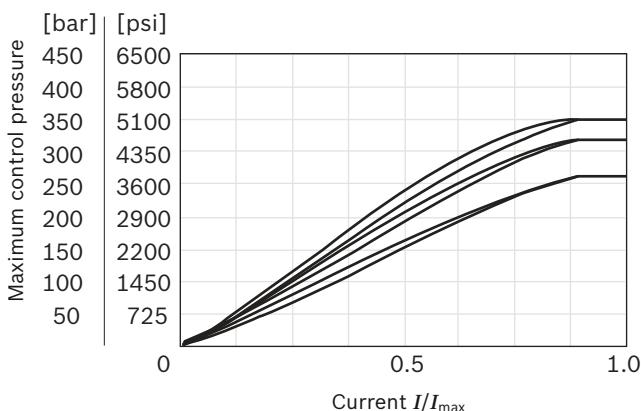

250, 315 and 350 bar (3600, 4550 and 5100 psi) plus 14 bar (200 psi) Δp .

- Standard is 350 bar (5100 psi).

When ordering, the correct pressure value is selected by Rexroth.

Notes and explanations for the pressure controller can be found on page 25.

▼ Characteristic curve T6

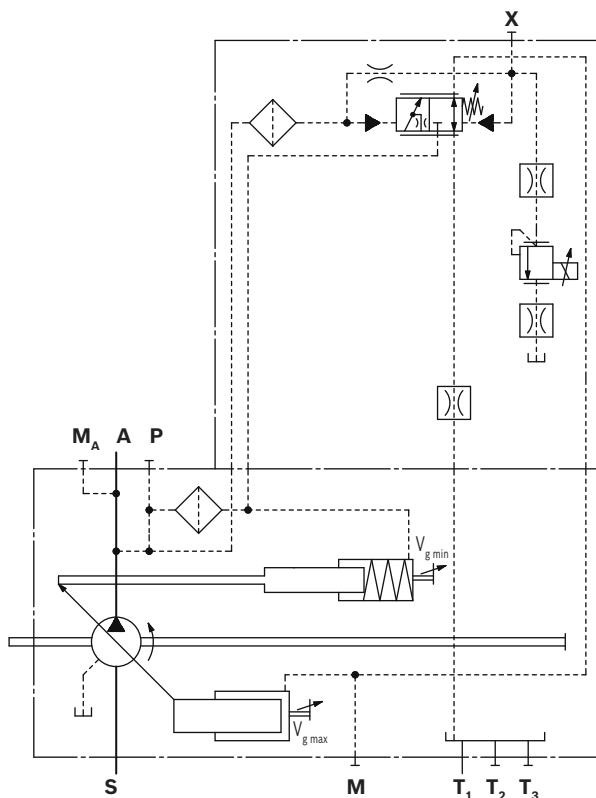

Technical data, solenoid	T6
Voltage	24 V
Control current	
Minimum pressure p_{\min}	0 mA
Maximum pressure p_{\max}	1200 mA
Maximum rated current	1200 mA
Nominal resistance (at 20 °C (68 °F))	4.8 Ω
Dither frequency	200 Hz
Duty cycle	100%
Type of protection: see connector version page 68

DGT8 – With integrated pilot control valve, electric-proportional override (negative control)

The remote controlled pressure controller has a fixed-setting Δp value. An electric pressure relief valve (pilot valve) integrated in the control valve enables remote pressure control.

- Fixed value at Δp 14 bar (200psi).

When ordering, state in plain text:

- Maximum pressure p_{\max} [bar (psi)] (pressure on port **A**) with 0 mA current.

Pilot valve T8

The electric-proportional pressure relief valve is directly controlled with a negative control as cartridge version (see data sheet 18139-07).

The following pressure settings are available:

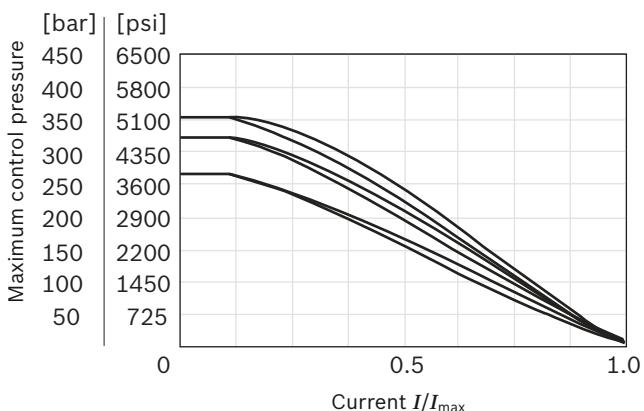

250, 315 and 350 bar (3600, 4550 and 5100 psi) plus 14 bar (200 psi) Δp .

- Standard is 350 bar (5100psi).

When ordering, the correct pressure value is selected by Rexroth.

Notes and explanations for the pressure controller can be found on page 25.

▼ Characteristic curve T8

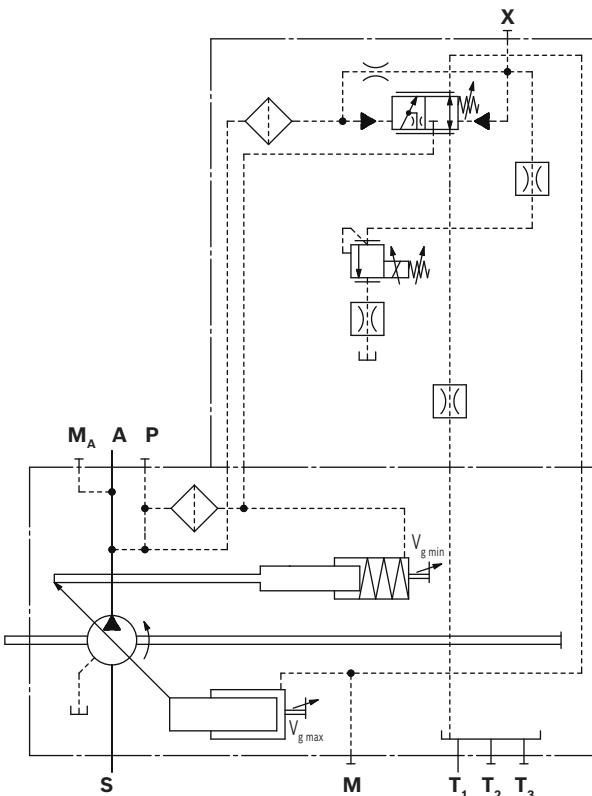

Technical data, solenoid	T8
Voltage	24 V
Control current	
Maximum pressure p_{\max}	0 mA
Minimum pressure p_{\min}	1200 mA
Maximum rated current	1200 mA
Nominal resistance (at 20 °C (68 °F))	4.8 Ω
Dither frequency	200 Hz
Duty cycle	100%
Type of protection: see connector version page 68

▼ Circuit diagram DGT8

S3/S4 – Load-sensing controller, electric-proportional override (negative control)

A control current acts against the adjustment spring of the load-sensing controller via a proportional solenoid.

The mechanically adjusted differential pressure can be reduced by means of different control current settings.

Increasing control current = reduced differential pressure.

- Reduced differential pressure/control current =

At **S3** 3.1 bar (45 psi)/ 200 mA

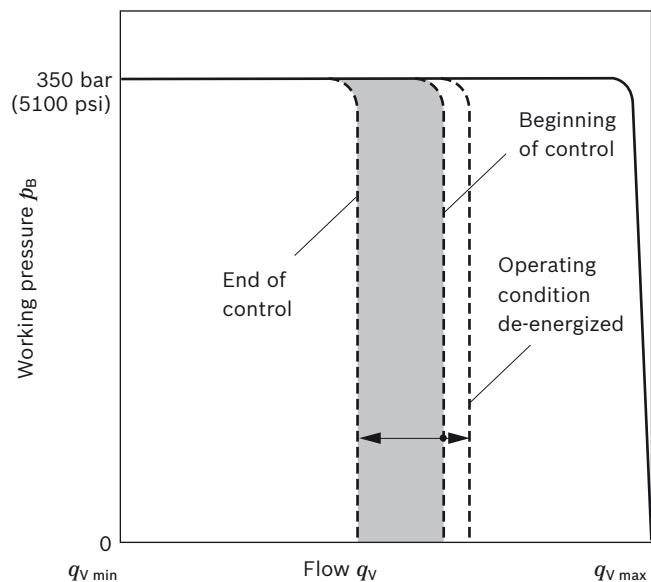

At **S4** 3.1 bar (45 psi)/ 100 mA

Technical data, solenoid	S3	S4
Voltage	12 V ($\pm 20\%$)	24 V ($\pm 20\%$)
Control current		
Beginning of control	400 mA	200 mA
End of control	1200 mA	600 mA
Current limit	1.54 A	0.77 A
Nominal resistance (at 20 °C (68 °F))	5.5 Ω	22.7 Ω
Dither frequency	100 Hz	100 Hz
Duty cycle	100%	100%
Type of protection: see connector version page 68		

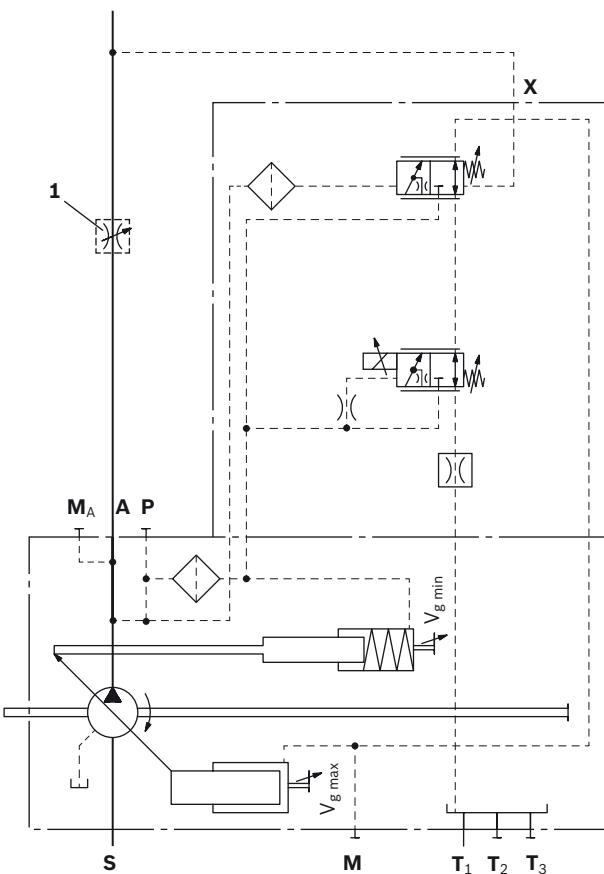

When ordering, state in plain text:

- Differential pressure setting Δp [bar] with control current 200 mA.
- $\Delta p_{\text{metering orifice}} = p_{\text{pump}} - p_{\text{consumer}}$
- Setting range for Δp 20 bar (290 psi) to 30 bar (435 psi) at 200 mA
- Standard adjustment 20 bar (290 psi) at 200 mA

▼ Characteristic curve DRS4

Circuit diagram DRS4

- 1 The metering orifice (control block) is not included in the scope of delivery.

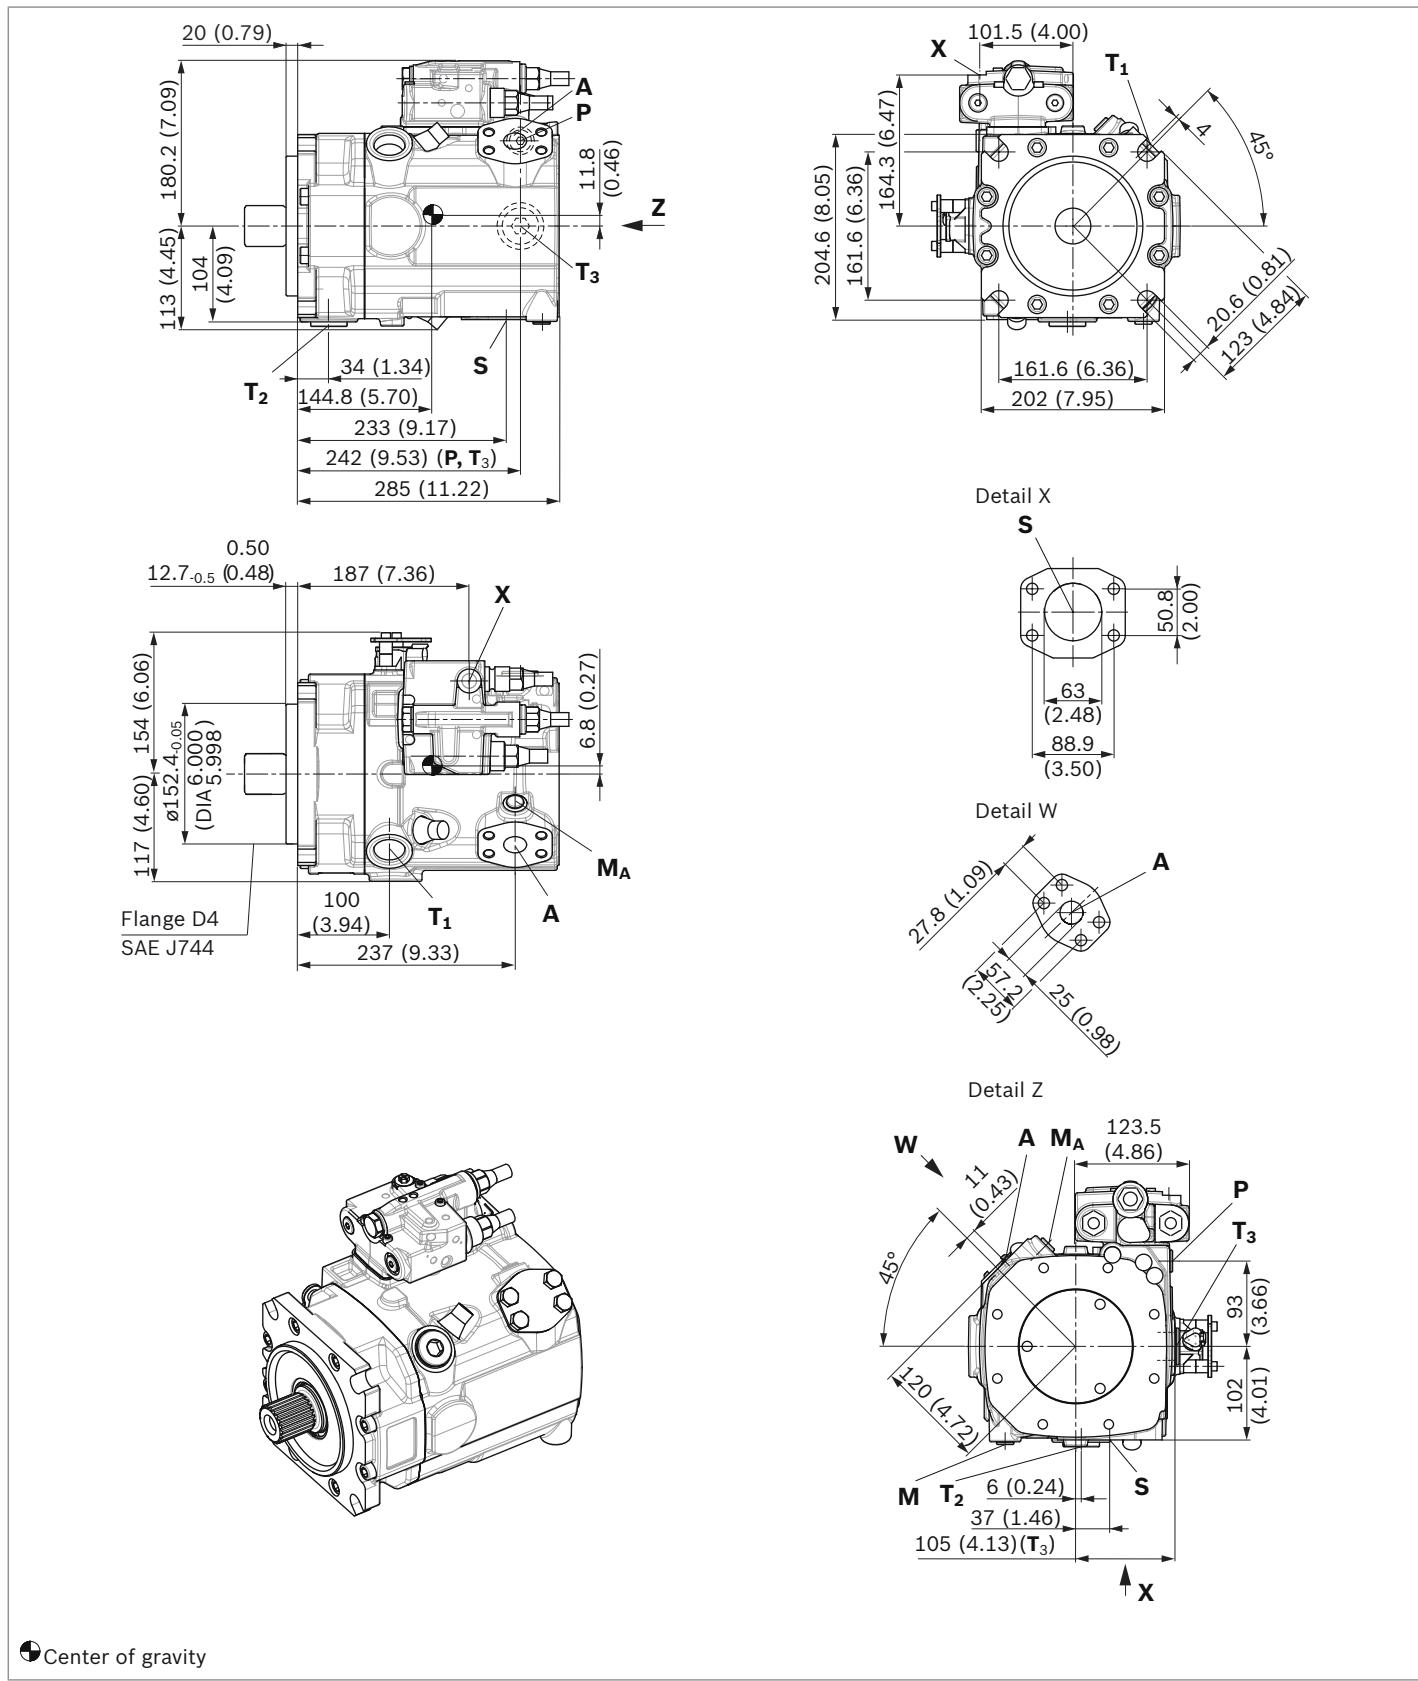

Notice

- In operating condition **S3** de-energized (jump 400 to 0 mA): Increased differential pressure by 3.2 bar (45 psi).
- In operating condition **S4** de-energized (jump 200 to 0 mA): Increased differential pressure by 3.2 bar (45 psi).

⁵⁾ Depending on the application, momentary pressure peaks can occur.

Keep this in mind when selecting measuring devices and fittings.

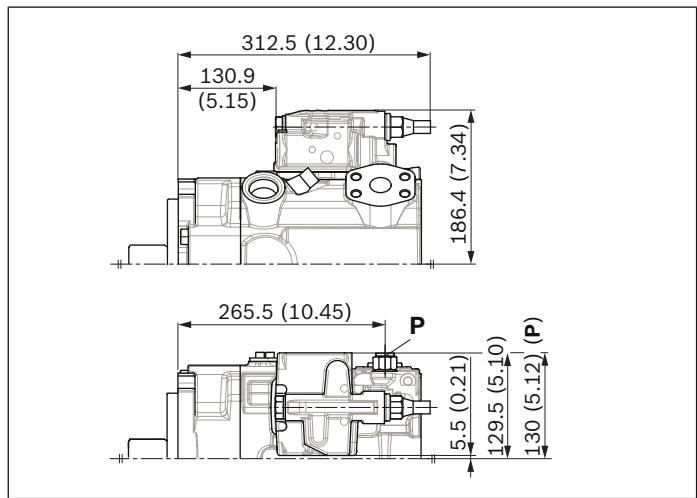

⁶⁾ Metric fastening thread is a deviation from standard.

⁷⁾ The countersink can be deeper than as specified in the standard.

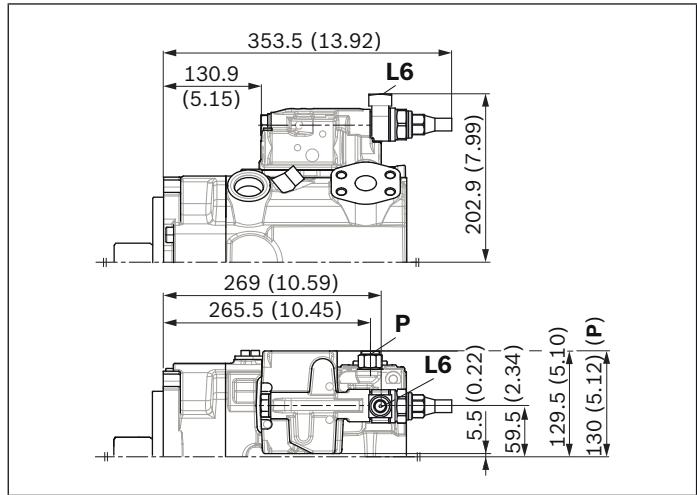

⁸⁾ Depending on installation position, T₁, T₂ or T₃ must be connected
(see also Installation instructions on pages 69 and 70).

⁹⁾ O = Must be connected (plugged when delivered)

X = Plugged (in normal operation)

Mounting situation combination pumps in relation to each other

Port **S** of the relevant mounting unit in relation to port **S** of the first pump is always used as orientation.

Below, you will find an example with three attachment pumps:

1st pump	2nd pump	3rd pump
Alignment port S	Mounting angle to 1st pump	Mounting angle to 1st pump
Example: without code	-M270	-M90

Details of the mounting situation are provided following the order designation for the relevant combination or mounting unit.

Alignment clockwise viewed on through drive.

Ordering example

By using combination pumps, it is possible to have independent circuits without the need for splitter gearboxes. When ordering combination pumps, the type designations of the 1st and 2nd pump must be connected with a "+" and the mounting situation must be added as described on page 66.

Order example:

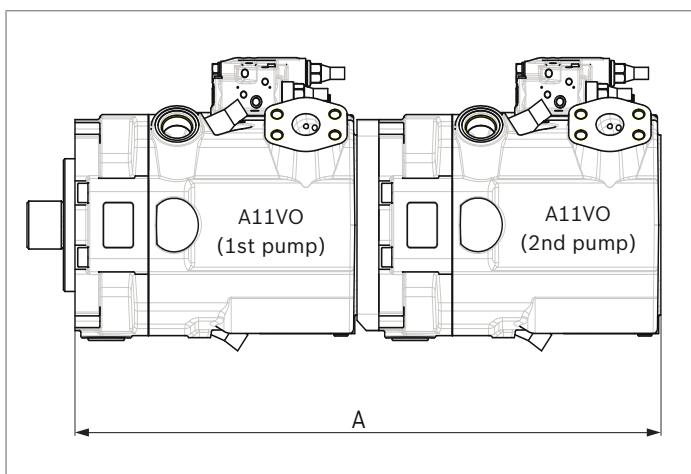

A11VO280LRDRA00/41M(A)RVE4A41SE4A40-0+

A11VO280LRDRA00/41M(A)RVE4A41SU0000-0-M...

A tandem pump consisting of two equal sizes is permissible without additional supports assuming that the dynamic mass acceleration does not exceed maximum 10 g (= 98.1 m/s²). For combination pumps consisting of more than two pumps, the mounting flange must be rated for the permissible mass torque.

Notice

The combination pump type code is shown in shortened form in the order confirmation.

Connector for solenoids

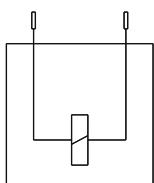

DEUTSCH DT04-2P-EP04

Molded connector, 2-pin, without bidirectional suppressor diode

There is the following type of protection with the installed mating connector:

- ▶ IP67 (DIN/EN 60529) and
- ▶ IP69K (DIN 40050-9)

▼ Switching symbol

▼ Mating connector DEUTSCH DT06-2S-EP04

Consisting of	DT designation
1 housing	DT06-2S-EP04
1 wedge	W2S
2 sockets	0462-201-16141

The mating connector is not included in the scope of delivery.

This can be supplied by Bosch Rexroth on request (material number R902601804).

Notice

If necessary, you can change the position of the connector by turning the solenoid.

The procedure is defined in the instruction manual.

Installation instructions

General

The axial piston unit must be filled with hydraulic fluid and air bled during commissioning and operation. This must also be observed following a longer standstill as the axial piston unit may empty via the hydraulic lines.

Particularly in the installation position "drive shaft upwards", filling and air bleeding must be carried out completely as there is, for example, a danger of dry running. The case drain fluid in the housing area must be directed to the reservoir via the highest available drain port (**T₁**, **T₂**, **T₃**). For combination pumps, the leakage must be drained off at each pump.

If a shared drain line is used for several units, make sure that the respective case pressure is not exceeded. The shared drain line must be dimensioned to ensure that the maximum permissible case pressure of all connected units is not exceeded in any operational conditions, particularly at cold start. If this is not possible, separate drain line must be laid, if necessary.

To achieve favorable noise values, decouple all connecting lines using elastic elements and avoid above-reservoir installation.

In all operating conditions, the suction line and drain line must flow into the reservoir below the minimum fluid level. The permissible suction height h_S results from the total pressure loss. However, it must not be higher than $h_{S\ max} = 800$ mm (31.50 in). The minimum suction pressure at port **S** must also not fall below 0.8 bar (12 psi) absolute (without charge pump) or 0.7 bar (11 psi) absolute (with charge pump) during operation and during a cold start. When designing the reservoir, ensure adequate distance between the suction line and the case drain line. This prevents the heated, return flow from being drawn directly back into the suction line.

Notice

In certain installation positions, an influence on the control or closed loop control can be expected. Gravity, dead weight and case pressure can cause minor characteristic shifts and changes in response time.

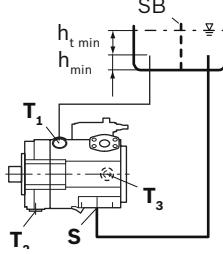

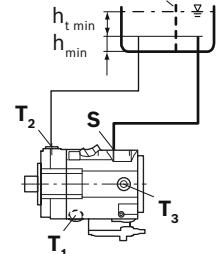

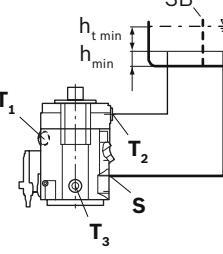

Installation position

See the following examples **1** to **9**.

Further installation positions are available upon request.
Recommended installation position: **1** and **2**

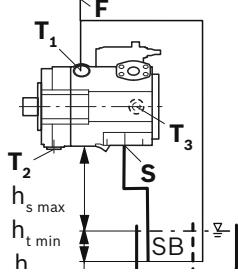

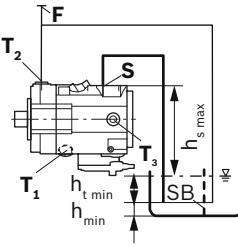

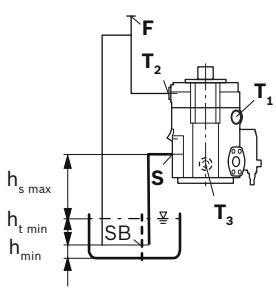

Below-reservoir installation (standard)

Below-reservoir installation means that the axial piston unit is installed outside of the reservoir and below the minimum fluid level of the reservoir.

Installation position	Air bleed	Filling
1	T₁	S + T₁
		
2	T₂	S + T₂
		
3	T₂	S + T₂
		
Key		
L	Filling / air bleeding	
S	Suction port	
T	Drain port	
SB	Baffle (baffle plate)	
$h_{t\ min}$	Minimum required immersion depth (200 mm (7.87 in))	
h_{min}	Minimum required distance to reservoir bottom (100 mm (3.94 in))	
$h_{ES\ min}$	Minimum necessary height required to protect the axial piston unit from draining (25 mm (1 in))	
$h_{S\ max}$	Maximum permissible suction height (800 mm (31.50 in))	

Above-reservoir installation

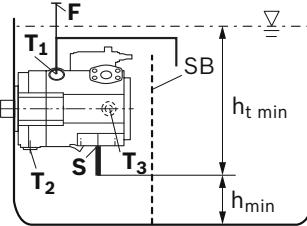

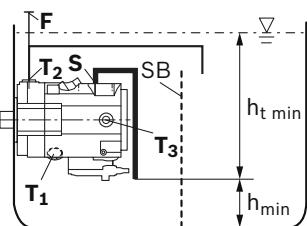

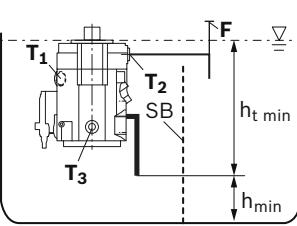

Above-reservoir installation means that the axial piston unit is installed above the minimum fluid level of the reservoir. To prevent the axial piston unit from draining, a height difference $h_{ES\ min}$ of at least 25 mm (1 in) at port **T₂** is required in position 6. Observe the maximum permissible suction height $h_{S\ max} = 800$ mm (31.50 in). The above-reservoir installation is not permitted for units with charge pump (A11VLO).

Installation position	Air bleed	Filling
4	F	T₁ (F)
		
5	F	T₂ (F)
		
6	F	T₂ (F)
		

Inside-reservoir installation

Inside-reservoir installation is when the axial piston unit is installed in the reservoir below the minimum fluid level. The axial piston unit is completely below the hydraulic fluid. If the minimum fluid level is equal to or below the upper edge of the pump, see chapter **"Above-reservoir installation"**.

Axial piston units with electric components (e.g. electric controls, sensors) must not be installed in a reservoir below the fluid level.

Installation position	Air bleed	Filling
7	Via the highest available port T₁	Automatically via the open port T₁ due to the position under the hydraulic fluid level
		
8	Via the highest available port T₂	Automatically via the open port T₂ due to the position under the hydraulic fluid level
		
9	Via the highest available port T₂	Automatically via the open port T₂ due to the position under the hydraulic fluid level
		

Notice

Port **F** is part of the external piping and must be provided on the customer side to make filling and air bleeding easier.

Project planning notes

- ▶ The A11V(L)O axial piston variable pump is designed to be used in open circuits.
- ▶ The project planning, installation and commissioning of the axial piston unit requires the involvement of qualified skilled personnel.
- ▶ Before using the axial piston unit, please read the corresponding instruction manual completely and thoroughly. If necessary, this can be requested from Bosch Rexroth.
- ▶ Before finalizing your design, please request a binding installation drawing.
- ▶ The specified data and notes contained herein must be observed.
- ▶ Depending on the operating conditions of the axial piston unit (working pressure, fluid temperature), the characteristic curve may shift.
- ▶ The characteristic curve may also shift due to the dither frequency or control electronics.
- ▶ Preservation: Our axial piston units are supplied as standard with preservative protection for a maximum of 12 months. If longer preservative protection is required (maximum 24 months), please specify this in plain text when placing your order. The preservation periods apply under optimal storage conditions, details of which can be found in the data sheet 90312 or in the instruction manual.
- ▶ Not all versions of the product are approved for use in a safety function according to ISO 13849. Please consult the responsible contact person at Bosch Rexroth if you require reliability parameters (e.g. MTTF_d) for functional safety.
- ▶ Depending on the type of control used, electromagnetic effects can be produced when using solenoids. When a direct current is applied, solenoids do not cause electromagnetic interference nor is their operation impaired by electromagnetic interference.
Other behavior can result when a modulated direct current (e.g. PWM signal) is applied. Potential electromagnetic interference for persons (e.g. persons with a pacemaker) and other components must be tested by the machine manufacturer.
- ▶ Pressure controllers are not safeguards against pressure overload. Be sure to add a pressure relief valve to the hydraulic system.
- ▶ Working ports:
 - The ports and fastening threads are designed for the specified maximum pressure. The machine or system manufacturer must ensure that the connecting elements and lines correspond to the specified application conditions (pressure, flow, hydraulic fluid, temperature) with the necessary safety factors.
 - The working ports and function ports are only intended to accommodate hydraulic lines.

Safety instructions

- ▶ During and shortly after operation, there is a risk of getting burnt on the axial piston unit and especially on the solenoids. Take the appropriate safety measures (e.g. by wearing protective clothing).
- ▶ Moving parts in control equipment (e.g. valve spools) can, under certain circumstances, get stuck in position as a result of contamination (e.g. contaminated hydraulic fluid, abrasion, or residual dirt from components). As a result, the hydraulic fluid flow and the build-up of torque in the axial piston unit can no longer respond correctly to the operator's specifications. Even the use of various filter elements (external or internal flow filtration) will not rule out a fault but merely reduce the risk. The machine/system manufacturer must test whether additional measures are required on the machine for the relevant application in order to bring the driven consumer into a safe position (e.g. safe stop) and ensure any measures are properly implemented.
